

CollisionIQ

Communication Intelligence for Collision Shops

Advisor Workflow Manual

Operational Guide for Advisors

Covers escalations, CSI risk, bilingual communication, and customer workflow standards.

SECTIONS

- 01 Escalation Protocol** How to identify, respond to, and resolve CSI risk flags.
- 02 CSI Risk Management** Understanding risk levels and advisor responsibilities.
- 03 Bilingual Communication** Guidelines for English and Spanish customer interactions.
- 04 Customer Workflow Standards** Meeting customer expectations throughout the repair.
- 05 Advisor Queue Management** Managing review and resolution workflow.
- 06 Quick Reference** At-a-glance guide for common advisor actions.

01 Escalation Protocol

CollisionIQ monitors every inbound customer message for escalation signals. When a signal is detected, automated replies are immediately paused and the vehicle is flagged for advisor review. Your response time matters — escalated customers are at the highest risk of leaving a negative survey.

What triggers an escalation

- Anger or Hostility — words like angry, ridiculous, furious, or unacceptable.
- Frustration — phrases like frustrated, not happy, taking too long, or been waiting.
- Legal Language — mentions of lawyer, attorney, sue, or legal action.
- Insurance Dispute — phrases like claim denied, insurance won't cover, or bad faith.

IMPORTANT

When a vehicle is escalated, CollisionIQ does NOT send any automated replies until an advisor manually marks it resolved. The customer receives no further messages until you act.

Escalation Response Steps

1

Go to the CSI Risk tab

The red badge on the CSI Risk tab shows the number of open escalations. Open the tab immediately when you see it.

2

Review the triggering message

Read the customer message that caused the flag. The Flagged Because section explains what was detected and why.

3

Read the CollisionIQ Resolution

CollisionIQ provides a specific recommended action for each flag type. Follow it.

4

Generate the callback script

Click Generate Call Script. CollisionIQ writes a phone script tailored to the customer, vehicle, and flag type.

5

Call the customer

Use the Call button or dial directly. Do not attempt to resolve escalations by text alone. Voice calls de-escalate faster.

6

Mark Resolved

Once the situation is addressed, click Mark Resolved. Automated replies resume immediately.

TIP

Most escalations resolve in a single phone call when the advisor acknowledges the concern and provides a clear next step with a specific date or time. Avoid vague responses like we will look into it.

02 CSI Risk Management

Every vehicle in CollisionIQ has a CSI risk level. Understanding what each level means and what actions it requires is a core part of the advisor role.

● CSI Stable

Communication is current. No escalation signals detected. The customer is informed and the repair is progressing normally.

- Continue sending scheduled updates.
- Update stages promptly when the vehicle moves.
- No additional advisor action required.

● CSI Monitor

A potential issue is forming. The customer may be approaching 48 hours without contact, or the stage transition is overdue.

- Check the last outbound message date.
- If approaching 48 hours, send an update now.
- Review the vehicle notes for any pending actions.

● CSI Risk

An escalation has been detected or communication has lapsed beyond acceptable limits. Automated replies are paused.

- Go to the CSI Risk tab immediately.
- Call the customer the same day.
- Do not let a red flag sit unresolved overnight.

Advisor Responsibility by Risk Level

Level	Status	Action Required	Target Response
Green	Monitor	None required	Next scheduled update
Yellow	Review	Check last contact date	Within 24 hours
Red	Act Now	Call customer today	Same day — no exceptions

03 Bilingual Communication

CollisionIQ is designed to serve both English and Spanish speaking customers without any manual effort from advisors. Understanding how the bilingual system works ensures customers always receive the right experience.

How language is set

- Language is selected during vehicle check-in — English or Spanish.
- CollisionIQ uses this setting for every automated message throughout the repair.
- Welcome messages, stage updates, scheduled updates, and the survey prompt are all sent in the customer language.
- Advisors do not need to translate or modify messages — CollisionIQ handles it automatically.

Regional Tone on Pro and Max plans

On CollisionIQ Pro and Max, the system uses regional tone calibration specific to El Paso and the surrounding area. Spanish replies are written in warm, natural Mexican Spanish — not formal or generic translations. When Regional Tone Active appears in the communication thread header, this calibration is running.

IMPORTANT

Language cannot be changed after a vehicle is checked in. If the wrong language was selected, notify your supervisor. A new vehicle entry may need to be created.

Escalation language

Escalation detection works in both English and Spanish. CollisionIQ monitors for frustration and legal language regardless of which language the customer uses. The escalation labels shown to advisors are always in English for consistency.

TIP

If a Spanish-speaking customer writes in English or vice versa, CollisionIQ will still respond in the language set during check-in. Do not change the language setting mid-repair.

04 Customer Workflow Standards

CollisionIQ creates consistency across the shop by automating the communication touchpoints that matter most. Advisors play a critical role in keeping the workflow accurate.

Check In Within 30 Minutes

Every vehicle should be entered into CollisionIQ within 30 minutes of arriving at the shop. Delays in check-in delay the welcome message and start the repair on the wrong foot.

Update Stages Promptly

When a vehicle moves to a new repair stage, update it in CollisionIQ the same day. Stage updates send customer messages — outdated stages mean inaccurate communication.

Never Update a Stage That Has Not Changed

Only update the stage when the vehicle has actually moved. Sending a stage update for a vehicle still in the same stage sends a misleading message to the customer.

Do Not Override Escalations Without Calling

Marking an escalation resolved without speaking to the customer is against protocol. Always call first.

Review Your Queue Daily

Advisors should check the CSI Risk tab at the start and end of every shift. No flag should remain unreviewed for more than 4 hours during business hours.

05 Advisor Queue Management

The CSI Risk tab is the advisor's primary workspace for managing escalations. A well-managed queue protects CSI scores and ensures no customer falls through the cracks.

Daily Queue Review — Start of Shift

- Open the CSI Risk tab immediately when your shift begins.
- Note all open flags and their vehicle names.
- Prioritize any flags that were unresolved from the previous shift.
- Check the Triggering Message and CollisionIQ Resolution for each flag.
- Begin calling customers — start with the oldest unresolved flags first.

Daily Queue Review — End of Shift

- Review all open flags before leaving.
- If a flag cannot be resolved before end of shift, add an internal note in the vehicle record.
- Notify your supervisor of any flags that required escalation beyond a standard callback.
- Ensure no flag is left with zero contact attempts.

NEVER

Do not mark a flag resolved without speaking to the customer or confirming with your supervisor. Premature resolution defeats the purpose of CSI monitoring.

Resolved vs Open flags

Resolved flags move to the CSI Resolved section at the bottom of the queue page. They remain visible for the shift for reference. Open flags stay at the top and display a red badge count in the navigation until resolved.

TIP

If the same customer escalates twice in the same repair, notify the shop owner. Repeat escalations often signal a deeper issue with the repair itself, not just communication.

06 Quick Reference

SITUATION	ADVISOR ACTION
Vehicle just arrived	Check it into CollisionIQ within 30 minutes.
Vehicle moved to new stage	Update stage in CollisionIQ same day — message sends automatically.
Customer sends frustrated message	Go to CSI Risk tab — review flag — generate script — call customer.
Flag showing in CSI Risk tab	Read triggering message and CollisionIQ Resolution before calling.
Customer asks for update (off-schedule)	Update the stage if it changed, or use Scheduled Updates Send Now.
Wrong language selected at check-in	Notify supervisor — do not change mid-repair.
Vehicle delivered	CollisionIQ sends survey prompt automatically — no action needed.
Customer responds to pickup message	No response needed — this is expected and not flagged.
Escalation unresolved at end of shift	Note it in vehicle record and notify supervisor before leaving.
Regional Tone Active in thread header	CollisionIQ Pro/Max — El Paso Spanish calibration is running normally.

Escalation Keywords — What CollisionIQ Monitors

Anger / Hostility

angry, furious, unacceptable, ridiculous, terrible, hate, worst, horrible, pissed

Frustration

frustrated, frustration, not happy, taking too long, been waiting, upset, disappointed
