

CollisionIQ

Communication Intelligence for Collision Shops

Quick Start Guide

For Advisors & Front Desk Staff

Everything you need to start using CollisionIQ from day one.

WHAT'S INSIDE

- 01 Vehicle Intake** Check in vehicles and trigger automatic welcome messages.
- 02 Stage Updates** Update repair stages and notify customers automatically.
- 03 Advisor Queue** Handle escalations and CSI risk flags.
- 04 Communication Thread** Bill review, and send customer messages.
- 05 Scheduled Updates** Message Monday / Wednesday / Friday auto-sends.

01 Vehicle Intake

When a new vehicle arrives at the shop, checking it into CollisionIQ triggers an automatic welcome message to the customer. This is the first impression — make sure all information is accurate before confirming.

1

Click Add Vehicle

Tap the blue + Add vehicle button in the top right of the Dashboard.

2

Enter Customer Information

Fill in the customer name, phone number, vehicle year/make/model, license plate, and insurance company. Phone number is required — this is how messages are sent.

3

Select the Insurance Company

Choose from the dropdown. If not listed, select Other.

4

Set the Initial Stage

Select where in the repair process the vehicle currently is. Most new vehicles start at Vehicle Received.

5

Choose Customer Language

Select English or Spanish. CollisionIQ will reply to this customer in their chosen language automatically.

6

Assign an Advisor

Select the advisor responsible for this vehicle.

7

Click Check In & Send Welcome

CollisionIQ sends a welcome text immediately. You will see it appear in the communication thread.

TIP

The welcome message preview at the bottom of the modal shows exactly what the customer will receive. Review it before confirming.

02 Updating Repair Stages

Every time a vehicle moves to a new stage of the repair process, updating it in CollisionIQ automatically sends the customer a status update. This is one of the most important actions an advisor takes.

1

Open the Vehicle

Click the customer's name on the Dashboard to open their repair file.

2

Find the Repair Stages panel

On the right side of the vehicle detail view, you will see the repair stage tracker.

3

Tap the new stage

Click the stage you want to move the vehicle to. A confirmation panel will appear.

4

Set the Estimated Completion Date

Pick a date from the calendar. This is included in the customer message.

5

Click Confirm & Send Update

CollisionIQ sends the customer a message immediately. It will appear in the communication thread below.

TIP

When a vehicle reaches Delivered, CollisionIQ automatically sends a closing message that includes a survey prompt. You do not need to do anything extra.

03 Advisor Queue — CSI Risk

When CollisionIQ detects a concerning message from a customer — frustration, legal language, or an insurance dispute — automated replies are paused immediately and the vehicle is flagged. The CSI Risk tab is where you manage these situations.

How to identify a flagged vehicle

- A red CSI Risk label appears next to the customer's name on the Dashboard.
- The CSI Risk tab in the top navigation shows a red badge with the number of open flags.
- The communication thread for that vehicle shows a warning message explaining why replies were paused.

What to do

- Go to the CSI Risk tab.
- Review the flagged customer message shown in the Triggering Message section.
- Click Generate Call Script to get a suggested phone script for the callback.
- Call the customer directly using the Call button.
- Once resolved, click Mark Resolved. Automated replies will resume.

TIP

Never try to resolve an escalation through text alone. CollisionIQ pauses automated replies because the situation needs a human voice. Always call first.

04 Communication Thread

Every vehicle has a full communication thread showing all messages sent and received. You can simulate customer messages to test how CollisionIQ responds.

Reading the thread

- Customer messages appear on the LEFT in gray bubbles.
- CollisionIQ auto-replies appear on the RIGHT in blue — tagged with CollisionIQ.
- System notes appear centered in gray — these are internal events, not sent to customers.
- Escalation flags appear above the message that triggered them.

Simulating a customer message

The Simulate Customer Message box at the bottom of the thread lets you type a test message and see how CollisionIQ responds. Use the Quick Test buttons to test common scenarios including escalation triggers.

TIP

Quick Test buttons include an I'm upset option that triggers escalation detection. Use this during training to see how the system responds to frustrated customers.

05 Scheduled Updates

CollisionIQ automatically sends status updates to customers every Monday, Wednesday, and Friday. These go out without any advisor action required. The Scheduled Updates section within each vehicle lets you review, preview, and control these sends.

What you can do

- Toggle updates ON or OFF for a specific vehicle if needed.
- Change the send time using the time picker.
- Preview the next scheduled message before it sends by clicking Preview next update.
- Send an update early today using the Send Now button (only appears if today is a scheduled day).

TIP

If a customer asks for an update and it is not a scheduled day, use the Stage Update feature instead — it sends a message and records the stage change at the same time.

Quick Reference

TASK	HOW TO DO IT
Add a new vehicle	Dashboard → + Add vehicle button
Update repair stage	Dashboard → Vehicle → Repair Stages panel → tap stage
Send a manual message	Dashboard → Vehicle → Communication Thread → type message
Check CSI Risk flags	CSI Risk tab in top navigation
Resolve an escalation	CSI Risk tab → Mark Resolved after calling customer
Preview scheduled message	Dashboard → Vehicle → Scheduled Updates → Preview
Toggle scheduled updates	Dashboard → Vehicle → Scheduled Updates → toggle ON/OFF
Export repair record	Dashboard → Vehicle → Transfer Record → Copy full record

Key Things to Remember

- Always set the customer language correctly at check-in. It cannot be changed later.
- Never ignore a red CSI Risk flag. Call the customer the same day.
- Stage updates send messages. Only update the stage when it has actually changed.
- The thread is a log. Everything sent and received is recorded automatically.
- Escalated vehicles have AI replies paused. You must manually resolve the flag to resume.
